Empirical Evaluation

On-line learning for shortest-path search

- Conventional IDA* uses a cost bound parameter
- Simple bound setting can fail on trivial problems
- Learn a model of search space and adjust the bound online

Learning search space structure to control algorithms on-line works for shortest-path search, too!

[Empirical Evaluation](#)

■ Sliding Tile

■ Sqrt Puzzle

■ Vacuum Maze

■ Uniform Tree

■ **Conclusion**

Tree search for Planning

- Infinite tree: requires a cost bound
- How do we set the bound?

New incremental model:

- Works with real-value costs
- Can be trained on-line

IDA*_{IM}:

- Uses the incremental model to choose bounds
- Performs well on **all** domains tested

On-line learning to control search applies to shortest-path search, too!
