

Suboptimal Heuristic Search

Wheeler Ruml

University of New Hampshire

All actual work done by my fantastic students and collaborators.
Grateful thanks to NSF, BSF, and DARPA.

Heuristic Search Is Fundamental

Why Suboptimal?

■ Search Rocks

- Behavior of A*
- Optimal Isn't
- Problem Settings
- Info Sources
- Classic AI Agent
- Alg as Agent

Greedy Search

Bounded-suboptimal

Contract Search

Real-time Search

Conclusion

Search enables planning / action selection

- achieve goal robustly
- optimize resource use (time, energy, pollution, ...)
- autonomy or decision-support
- support retaskability, AGI

Search enables algorithms

- dynamic programming
- discrete optimization
- 'intractable' → possible

Heuristic Search Is Fundamental

Greedy Search

Bounded-suboptimal

Contract Search

Real-time Search

Conclusion

heuristic is more about procrastination or pruning than guidance

Optimal Search is Provably Impractical

all nodes with $g(n) + h(n) < f^*$

Helmert and Röger, “How Good is Almost Perfect?”, AAAI-08
Best Paper Award:

In many cases, such as the GRIPPER domain and a family of MICONIC tasks, there is no significant difference in node expansions between A* with an almost perfect heuristic and breadth-first search.

We suggest that, beyond a certain point, trying to improve a heuristic search algorithm by refining its heuristic estimates is basically fruitless.

Why Suboptimal?

Contract Search

Real-time Search

Conclusion

quickly find a solution within factor b of optimal

simple hack (Pohl, AIJ 1970): $f'(n) = g(n) + b \cdot h(n)$

$f_{min} = \text{lowest } f(n) \text{ on open}$

the key lemma: f_{min} is a global lower bound

1. any optimal path must pass through the frontier
2. let p be an open node along an optimal path
3. $f_{min} \leq f(p) = g(p) + h(p) \leq f^*$

can expand **any node** with $f(n) \leq b \cdot f_{min}$

Bounded-suboptimal Search: RR- d

Why Suboptimal?

Greedy Search

■ RR- d

■ Planning

■ Search

Contract Search

Real-time Search

Conclusion

quickly find a solution within factor b of optimal

two tasks: find $\text{sol} \leq b \cdot f_{\min}$, raise f_{\min}

RR- d (Fickert, Gu, and Ruml, AAI-22):

multi-queue alternation (Röger and Helmert, ICAPS-10)

open: sorted on \hat{f} , explore

focal: sorted on \hat{d} , exploit

cleanup: sorted on f , raise bound

filter for open and focal: $f(n) \leq b \cdot f_{\min}$

obvious ablations/substitutions are worse

IPC Coverage ($b = 1.5$)

[Real-time Search](#)

[Conclusion](#)

- Optimal search is impractical
- Lots of room for creativity in suboptimal search

Going beyond lower bounds on cost-to-go:

- Inadmissible cost-to-go \hat{f}
- Inadmissible distance-to-go \hat{d} : Speedy
- RR- d uses f , \hat{f} , and \hat{d}
 - see also XES (IJCAI-21)
 - see also EES/Anytime EES
 - see also Dynamic- \hat{f} (JAIR, 2015)
- DAS also uses expansion delay

next: exploiting estimates of uncertainty

[Conclusion](#)

minimin: parent gets best child's f
assumes no more information will become available

Bellman: parent gets expected-best child's \hat{f}
assumes no more information will become available

Nancy: parent gets expected-best child's belief
assumes no more information will become available

Cserna: parent gets expected min over all children's beliefs
assumes we will know optimal choices

something intermediate would seem appropriate!

Nancy's Response to the Central Issues

Why Suboptimal?

Greedy Search

Bounded-suboptimal

Contract Search

Real-time Search

■ Real-time Search

■ The Issues

■ Decision-making

■ Lookahead

■ Risky Lookahead

■ **Summary**

■ Whence Beliefs?

■ Completeness

■ Results

■ Planning

Conclusion

1. Lookahead:
Which nodes to expand?
those that minimize risk
2. Decision-making:
Which action to pick?
minimum \hat{f} (rationality)
3. Learning:
How to backup from frontier?
backup beliefs ('Nancy backups')

minimizing uncertainty drives the search

see also XES (bounded-cost search, IJCAI-21)

How to Form Beliefs?

Conclusion

Nancy: Heuristic values: scalar \rightarrow probability distribution (belief)

How to form beliefs?

assumptions:

Gaussian at \hat{f} with width $\propto \hat{d}$, truncated at f
online learning with few parameters

training data:

histogram of previous h^* given h
offline learning with many parameters

Example h^* Distribution: Transport vs Blocks World

What do the distributions look like?

Beliefs differ by domain. Often not Gaussian!

A New General Completeness Proof

■ Real-time Search

■ The Issues

■ Decision-making

■ Lookahead

■ Risky Lookahead

■ Summary

■ Whence Beliefs?

■ **Completeness**

■ Results

■ Planning

Conclusion

conditions on problem:

1. initial beliefs have finite expected value
2. positive action costs
3. finite state space
4. no dead-ends

conditions on algorithm:

1. goal-aware
2. learning creates local consistency (eg, DP)
3. selects actions via \hat{f}

This proof applies to any LSS-LRTA*-style algorithm

Example Results: Racetrack

[Contract Search](#)

[Real-time Search](#)

[Conclusion](#)

■ [Recap](#)

■ [Questions?](#)

Suboptimal search is the most important kind!

- practical instead of provably intractable
- distinct settings: bounded-suboptimal, contract, utility...

many sources of information beyond h !

- unbiased estimates (can be learned online)
- distance-to-go, not just cost
- beliefs can model uncertainty

search algorithm as agents

- entire AI agent toolbox applies
 - what to represent, how to estimate
 - how to exploit experience
- search highlights issues more clearly than RL

Suboptimal heuristic search needs YOU!
