[ILP](#)

- reduction in German population 15–30%
- in some territories 3/4 of the population died
- male population reduced by almost half
- population of Czech lands reduced by 1/3

Gottfried Wilhelm Leibniz (1646-1716)

[Leibniz](#)

[Logic in Practice](#)

[Logics of Action](#)

[ILP](#)

Leibniz's dream:

"a general method in which all truths of the reason would be reduced to a kind of calculation. At the same time this would be a sort of universal language or script, but infinitely different from all those projected hitherto; for the symbols and even the words in it would direct reason; and errors, except those of fact, would be mere mistakes in calculation."

If controversies were to arise, "there would be no more need of disputation between two philosophers than between two accountants. For it would suffice to take their pencils in their hands, and say to each other: Let us calculate."

Dissertio de Arte Combinatoria, 1666

Logics of Action

ILP

$$x \wedge y \rightarrow z \equiv \neg x \vee \neg y \vee z$$

at most one positive literal (exactly one = 'definite clause')

Cat(x) :- Furry(x), Meows(x).

Cat(y) :- Feline(y).

Furry(A).

Meows(A).

? Cat(z).

Still semi-decidable in first-order case.

Propositional: Unit resolution (Modus Ponens) is sound and complete in linear time for Horn theories: 'forward chaining'.
Each rule 'fires' at most once, each variable 'processed' at most once

'expert systems'

Logics of Action

ILP

Multiple aspects:

- A visual notation
- A restricted logic
- A set of implementation tricks

Typically:

- Efficient indexing
- Precomputation
- Methods for defaults or typicality

Aka: frames, inheritance networks, semantic graphs, description logics, terminological logics, ontologies

Description Logic

Logics of Action

ILP

1. concepts (primitive and derived), instances
2. roles (definitional) and properties (assertional)
3. subsumption: *subsumes* (x, y) iff
 - (a) x is a concept, and
 - (b) same primitive concept ancestor, and
 - (c) for each role of x with restriction r_x
 - i. y has same role with restriction r_y , and
 - ii. r_x subsumes r_y

Logics of Action

Event Calculus

[Leibniz](#)

[Logic in Practice](#)

[Logics of Action](#)

[Event Calculus](#)

[Situation Calculus](#)

[Problems](#)

[ILP](#)

Events and fluents are reified:

$$Member(E23, Flyings) \wedge Agent(E23, John) \wedge Happens(E23, I7) \dots$$
$$T(At(John, KN113), t_1) \wedge Terminates(E23, At(John, KN113), t_2) \dots$$

Situation Calculus

[Leibniz](#)

[Logic in Practice](#)

[Logics of Action](#)

■ [Event Calculus](#)

■ [Situation Calculus](#)

■ [Problems](#)

[ILP](#)

World state (= situation) is reified:

$$Result(GoForward, s_0) = s_1$$

$$Result(Turn(right), s_1) = s_2$$

$$\forall s, a, b \text{ Clear}(a, s) \wedge \text{Clear}(b, s) \rightarrow \text{On}(a, b, \text{Result}(\text{PutOn}(a, b), s))$$

Problems with Logic

Leibniz

Logic in Practice

Logics of Action

■ Event Calculus

■ Situation Calculus

■ Problems

ILP

Defaults: hard to have coherent semantics and efficient inference (default logics, answer set programming, probabilistic logic)

Ramification problem: choosing what to infer (specialized systems)

Retraction: when previous truth becomes false (truth maintenance systems)

Qualification problem: making rules correct (probabilistic logic)

Inductive Logic Programming

Three types:

Supervised: classification (= prediction of class)

Unsupervised: compression (= prediction of actual value)

Reinforcement: sequence of decisions with occasional reward

Each can be on-line (incremental) or off-line (batch).

Terminology:

1. Hypothesis space
2. Training data (vs test data, for off-line case)
3. Performance metric (often on validation data)

Inductive Logic Programming

Descriptions:

Father(Philip, Charles)

Father(Philip, Anne)

Mother(Mum, Margaret)

Mother(Mum, Elizabeth)

Married(Diana, Charles)

Married(Elizabeth, Philip)

Male(Philip)

Male(Charles)

Female(Beatrice)

Female(Margaret)

Classifications:

Grandparent(Mum, Charles)

Grandparent(Elizabeth, Beatrice)

\neg *Grandparent(Mum, Harry)*

\neg *Grandparent(Spencer, Peter)*

Background: $Parent(x,y) \leftrightarrow Mother(x,y) \vee Father(x,y)$

Target: $Grandparent(x,y) \leftrightarrow \exists z Parent(x,z) \wedge Parent(z,y)$

Given: ground facts and background definitions

Find: short (almost Horn) clauses that cover positive examples and not negative ones

Sequential covering ('FOIL')

$rules \leftarrow \{ \}$

Until no remaining positives (or good enough):

$new \leftarrow$ empty rule

While false positives (eg, covers any negatives):

 Add best single literal precondition

 Add new to $rules$

 Remove positive examples covered by new

Example

→ *Grandfather(x,y)*

■ EOLQs

New literals:

1. Any predicate over any variables, where at least one of the variables is in previous literal or head
2. $\text{Equal}(x, y)$, where x and y are already in rule
3. Negation of any of the above

Best: maximizes 'information gain'

Clause must be shorter than positives it explains (cf Ockham's razor).
