Heuristic Search

State: hypothetical world state

Operators: actions that modify world

Goal: desired state or test

(Herbert Simon and Allen Newell, “Computer simulation of human thinking and problem solving”, 1961)

DeGroot Results

Is iterative deepening real?

Heureka!

— *Archimedes*

Heuristic knowledge is useful, but not necessarily correct.

Heuristic algorithms use heuristic knowledge to solve a problem.

A *heuristic function* takes a state and returns a lower bound on the cost-to-go to reach a goal.

(Newell and Ernst, 1965; Lin, 1965)

Consider estimated final path cost! $f(n) = g(n) + h(n)$

$Q \leftarrow$ an ordered list containing just the initial state.

Loop

If Q is empty,
then return failure.

$Node \leftarrow \text{Pop}(Q)$.

If $Node$ is a goal,
then return $Node$ (or path to it)

else

$Children \leftarrow \text{Expand}(Node)$.

Merge $Children$ into Q , keeping **sorted by** $f(n)$. \leftarrow

An Example: the 8-puzzle

$h(n)$ = number of tiles out of place. (The blank is not a tile.)

	2	8	3		1	2	3
Start state:	1	6	4	Goal state:	8	□	4
	7	□	5		7	6	5

Please draw the tree resulting from the first two node expansions.

If h is admissible, other solutions at least as expensive!

1. Suppose p is on path to better solution b .
2. $f(p) = g(p) + h(p) \leq f(b) = g(b)$
3. But $g(s) = f(s) \leq f(p)$.
4. So $g(s) \leq g(b)$.

- EOLQs

1. For admissible h , f can be made non-decreasing.
2. A* expands nodes in order of non-decreasing f .
3. Must examine all nodes with $f < f^*$.

Simplified problem must give lower bound on original!

1. Relaxation: fewer and/or weaker constraints
 - Sometime efficient closed form
2. Abstraction: simplify token identity
 - Smaller search space

Want highest value

- If $h_1(n) \leq h_2(n)$ for all n , h_2 dominates h_1

Need fast computation

how to prove heuristic h admissible for problem P :

1. identify a simplified problem P'
2. show h is optimal for P'
3. show that P' easier than P
optimal solution for instance i' of P' is \leq
optimal sol for instance i of P
4. since h gives optimal values for P' , it is therefore admissible for P
