[Conclusion](#)

# Uniform Cost Search (Dijkstra, 1959)

Explore nodes in increasing order of cost-so-far ( $g(n)$ ):

$open \leftarrow$  ordered list containing the initial state

Loop

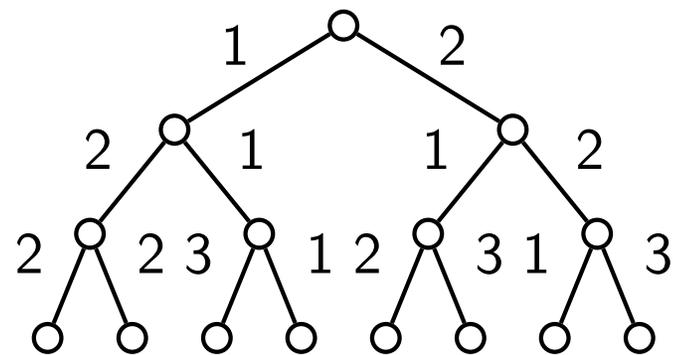

If  $open$  is empty, return failure

$Node \leftarrow$  pop cheapest node off  $open$

If  $Node$  is a goal, return it (or path to it)

$Children \leftarrow$  Expand( $Node$ ).

Merge  $Children$  into  $open$ , keeping sorted by  $g(n)$ .

- Dijkstra vs A\*
- Lower Bound
- Problems with A\*
- Example
- Problem Settings

Bounded Suboptimal

Conclusion

$$f(n) = g(n) + h(n)$$

$g(n)$  is actual cost-so-far, so  
when  $h(n)$  is a lower bound on cost-to-go,  
 $f(n)$  is a lower bound on cost of plan through  $n$

# Quick Note: A Lower Bound on Solution Cost

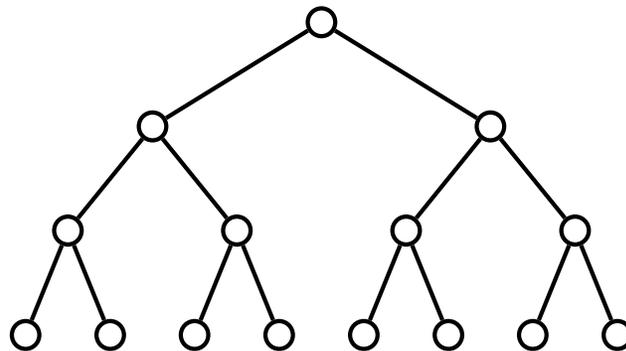

- Introduction

Optimal Planning

Bounded Suboptimal

- Intuition
- Three Heuristics
- Strategy
- Expansion Order
- Bound

■ **EES Performance**

Conclusion

**bounded suboptimal search:**  
minimize time subject to  
relative cost bound (factor of optimal)

■ Algs as Agents

- what are the problem settings?
  - ◆ guarantees beyond optimal search
  - ◆ eg, bounded suboptimal search
  - ◆ utility-based optimization
- what are the sources of information?
  - ◆ where do inadmissible heuristics come from?
  - ◆ estimates instead of lower bounds
  - ◆ distance in addition to cost
- how to exploit and combine information?
  - ◆ new generation of suboptimal algorithms
  - ◆ meta-reasoning
