CS 725/825 & IT 725 Lecture 17

Transport Layer

October 29, 2025

Network Congestion Control

Method:

```
TransWind = min(RecvWind, CongWind)

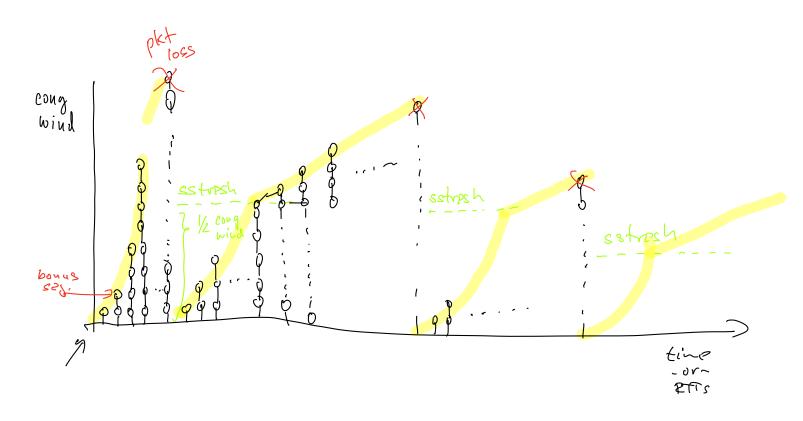

EffectiveWind = TransWind - (LastByteSent - LastByteAckd)
```

- ▶ EffectiveWind used in transmission
- RecvWind from Window Size field
- CongWind transmitter's estimate of how many unacknowledged packets can be pushed onto the network without causing congestion

Congestion Window (original)

- Components algorithms of TCP network congestion control (RFC 2001):
 - Slow Start initial growth of CongWind
 - Congestion Avoidance AIMD-based "search" for optimal rate
 - Fast Retransmit quick recovery from isolated packet losses
 - Fast Recovery undoing congestion control steps under Fast Recovery

TCP CONSESTION CONTROL

STEADS STATE...

Variants of TCP (examples)

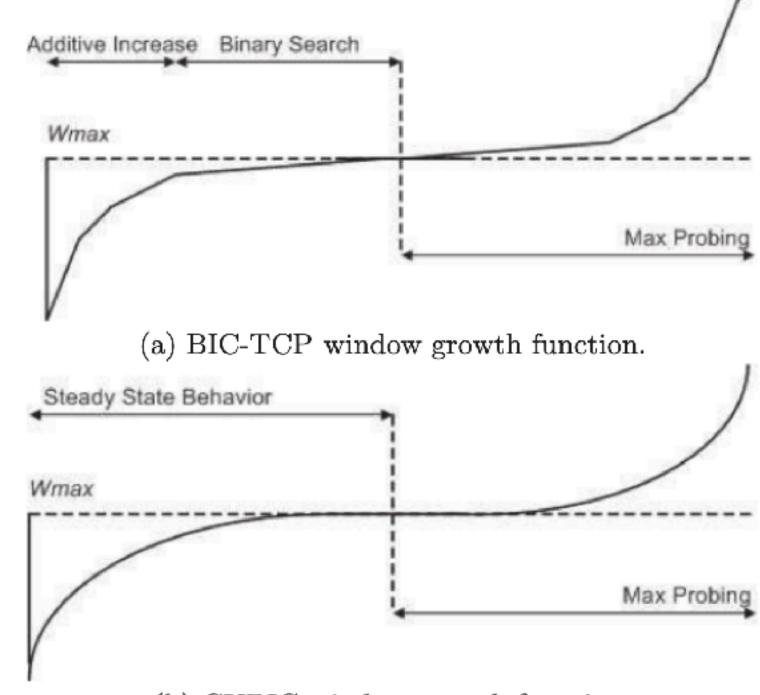

- Original TCP (RFC1122)
- TCP Tahoe (adds Fast Retransmit)
- TCP Reno (adds Fast Recovery)
- TCP Vegas (RTT-based)
- TCP BIC and CUBIC (Linux up to kernel 3.2)
- Compound TCP (Windows since Vista)
- TCP Proportional Rate Reduction (PRR) (Linux)
- TCP Bottleneck Bandwidth and Round-trip propagation time (BBR) (RTT-based, developed by Google)

TCP Vegas

- RTT observed
- An increase in RTT indicates congestion
 - reduce transmission rate
- Steady RTT measurements indicate underutilization
 - slowly increase transmission rate until RTT starts increasing

TOP CUBIC

- An update of TCP BIC (Binary Increase Congestion control)
- "modifies the linear window growth function of existing TCP standards to be a cubic function in order to improve the scalability of TCP over fast and long distance networks"

(b) CUBIC window growth function.

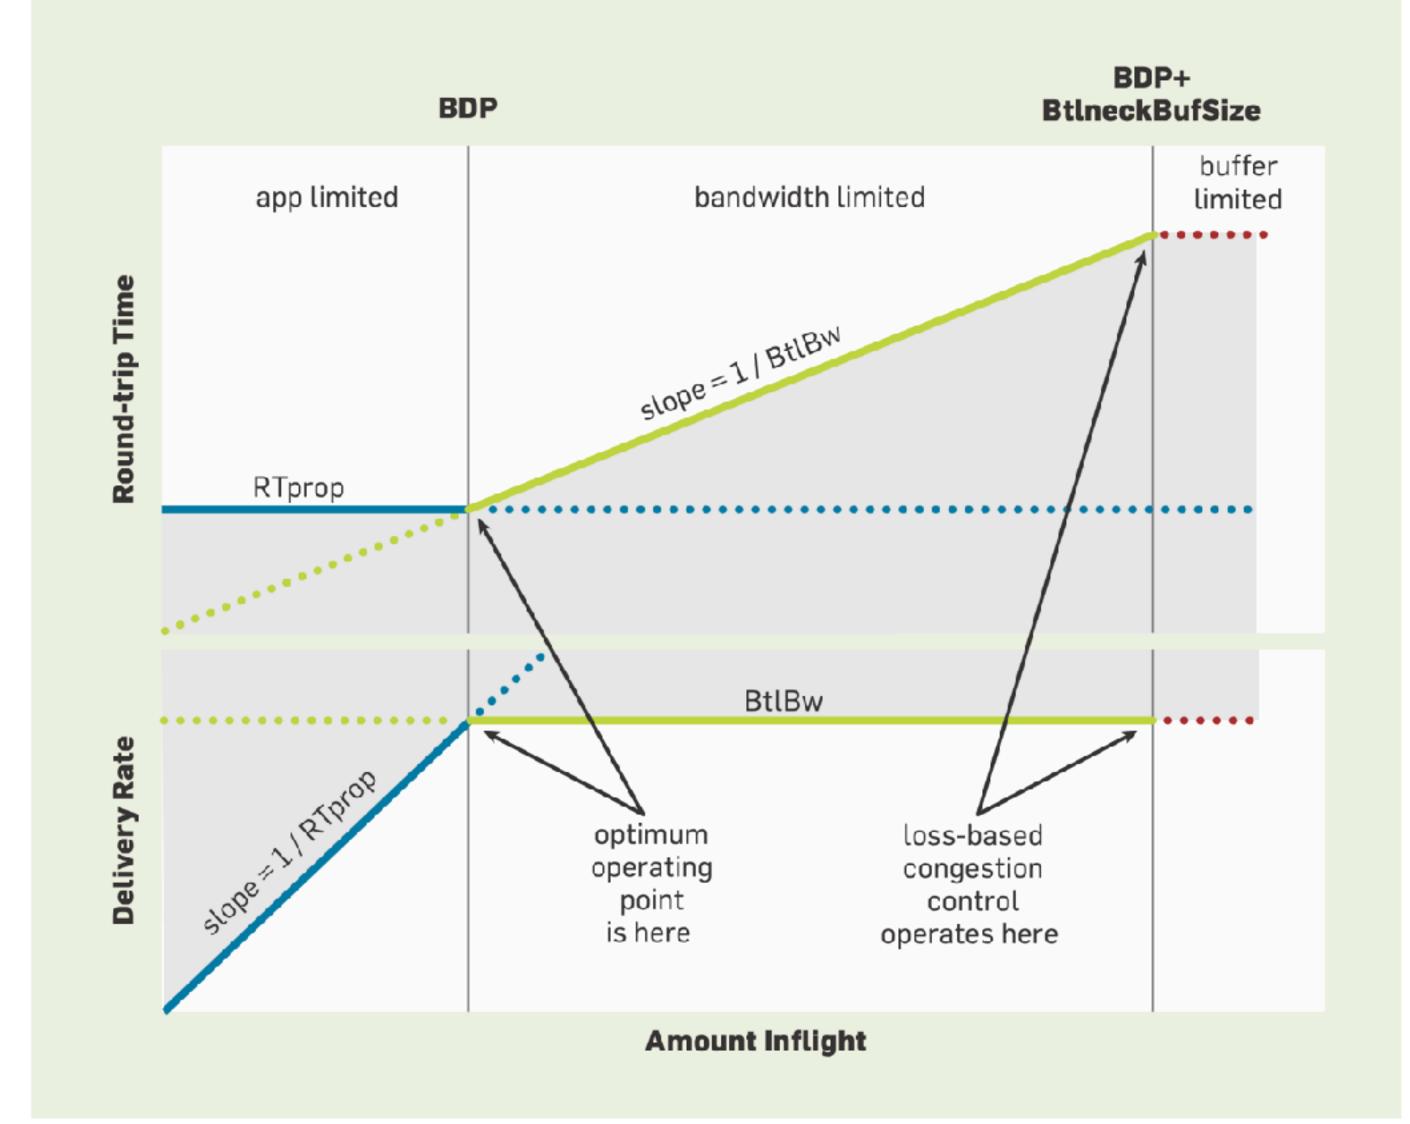

From: Sangtae Ha, Injong Rhee, and Lisong Xu. 2008. CUBIC: a new TCP-friendly high-speed TCP variant. SIGOPS Oper. Syst. Rev. 42, 5 (July 2008), 64–74. DOI:https://doi.org/10.1145/1400097.1400105

TOP BBR

- Bottleneck Bandwidth and Round-trip propagation time
- Designed by Google (~2016)
 - with YouTube as the motivating use case
 - available in Linux kernel 4.9+
- As the protocol name suggests:
 - "BBR congestion control computes the sending rate based on the delivery rate (throughput) estimated from ACKs" (comment in tcp-bbr.c in Linux kernel)

TOP BBR

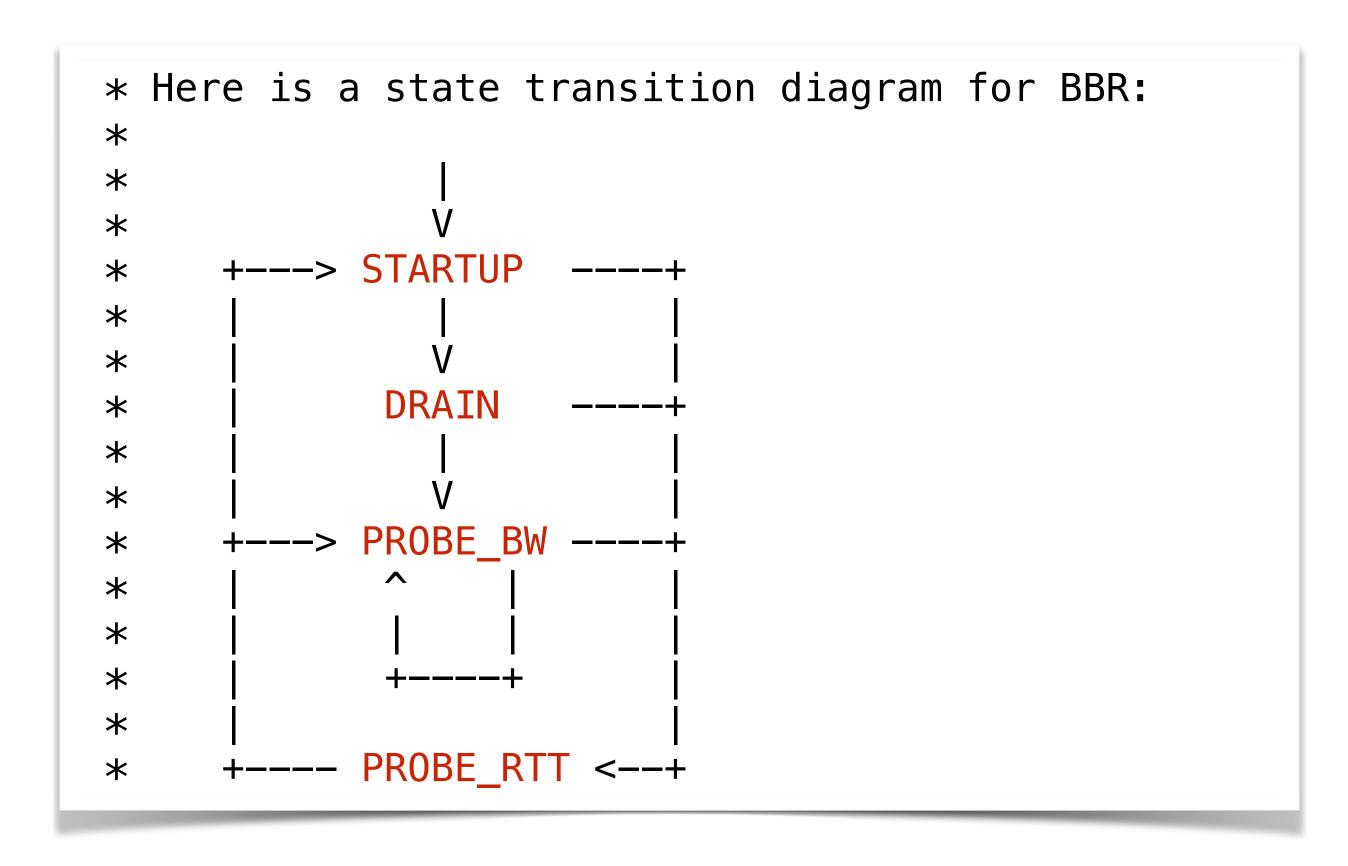

Source: Neal Cardwell, Yuchung Cheng, C. Stephen Gunn, Soheil Hassas Yeganeh, and Van Jacobson. 2017. *BBR: congestion-based congestion control.* Commun. ACM 60, 2 (February 2017), 58–66. https://doi.org/10.1145/3009824

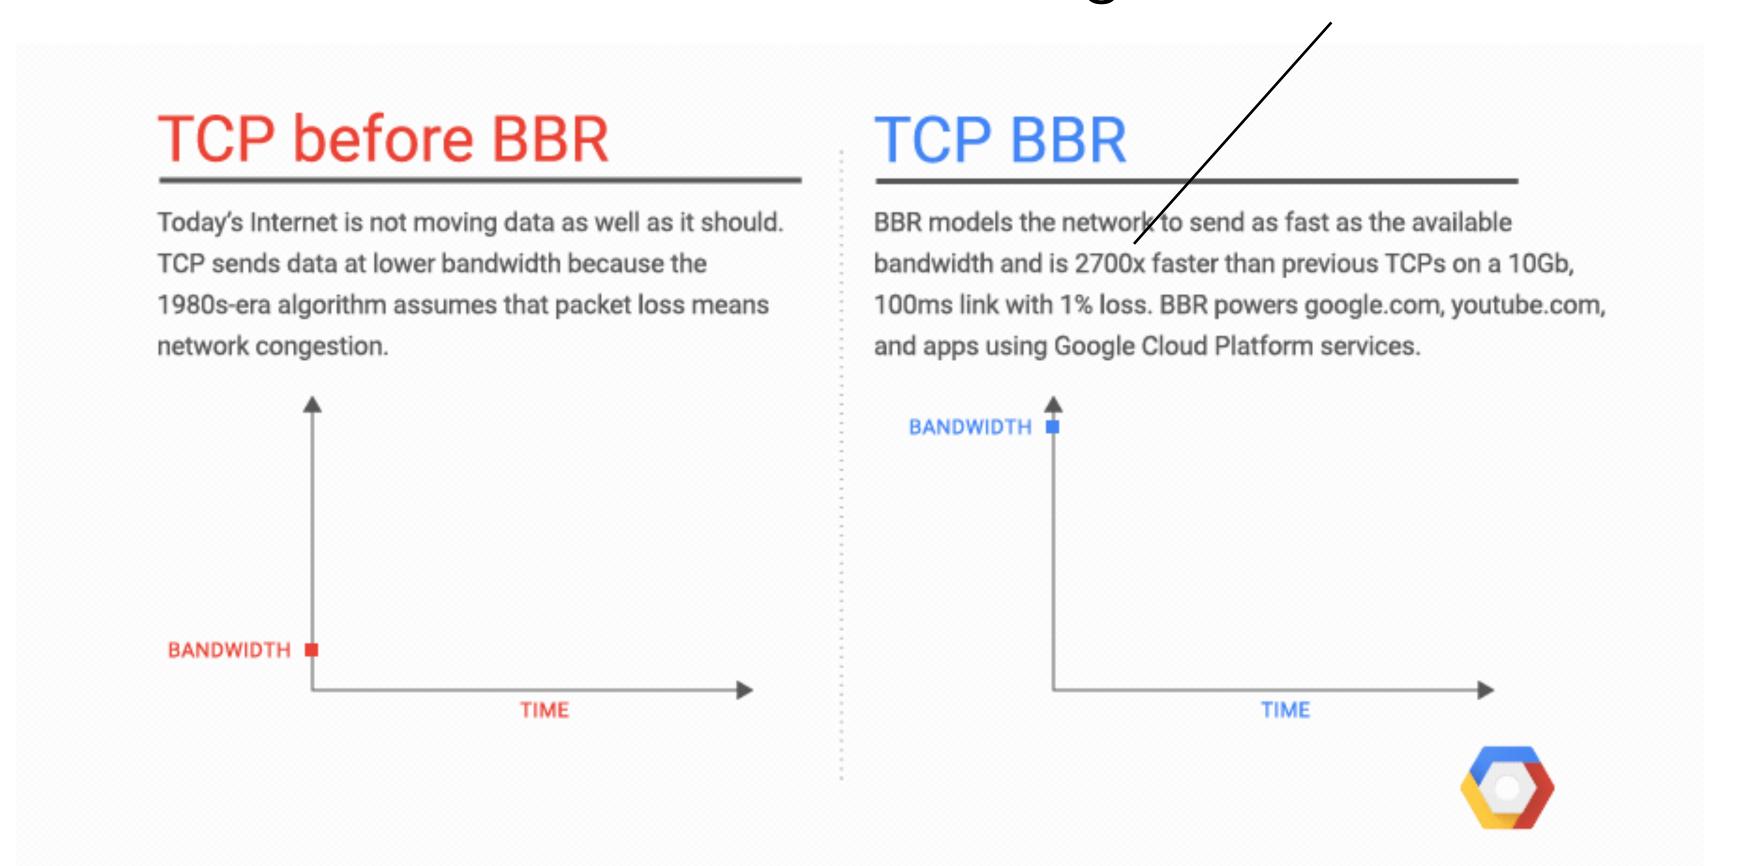

TCP BBR

Congestion control state diagram:

TOP BBR

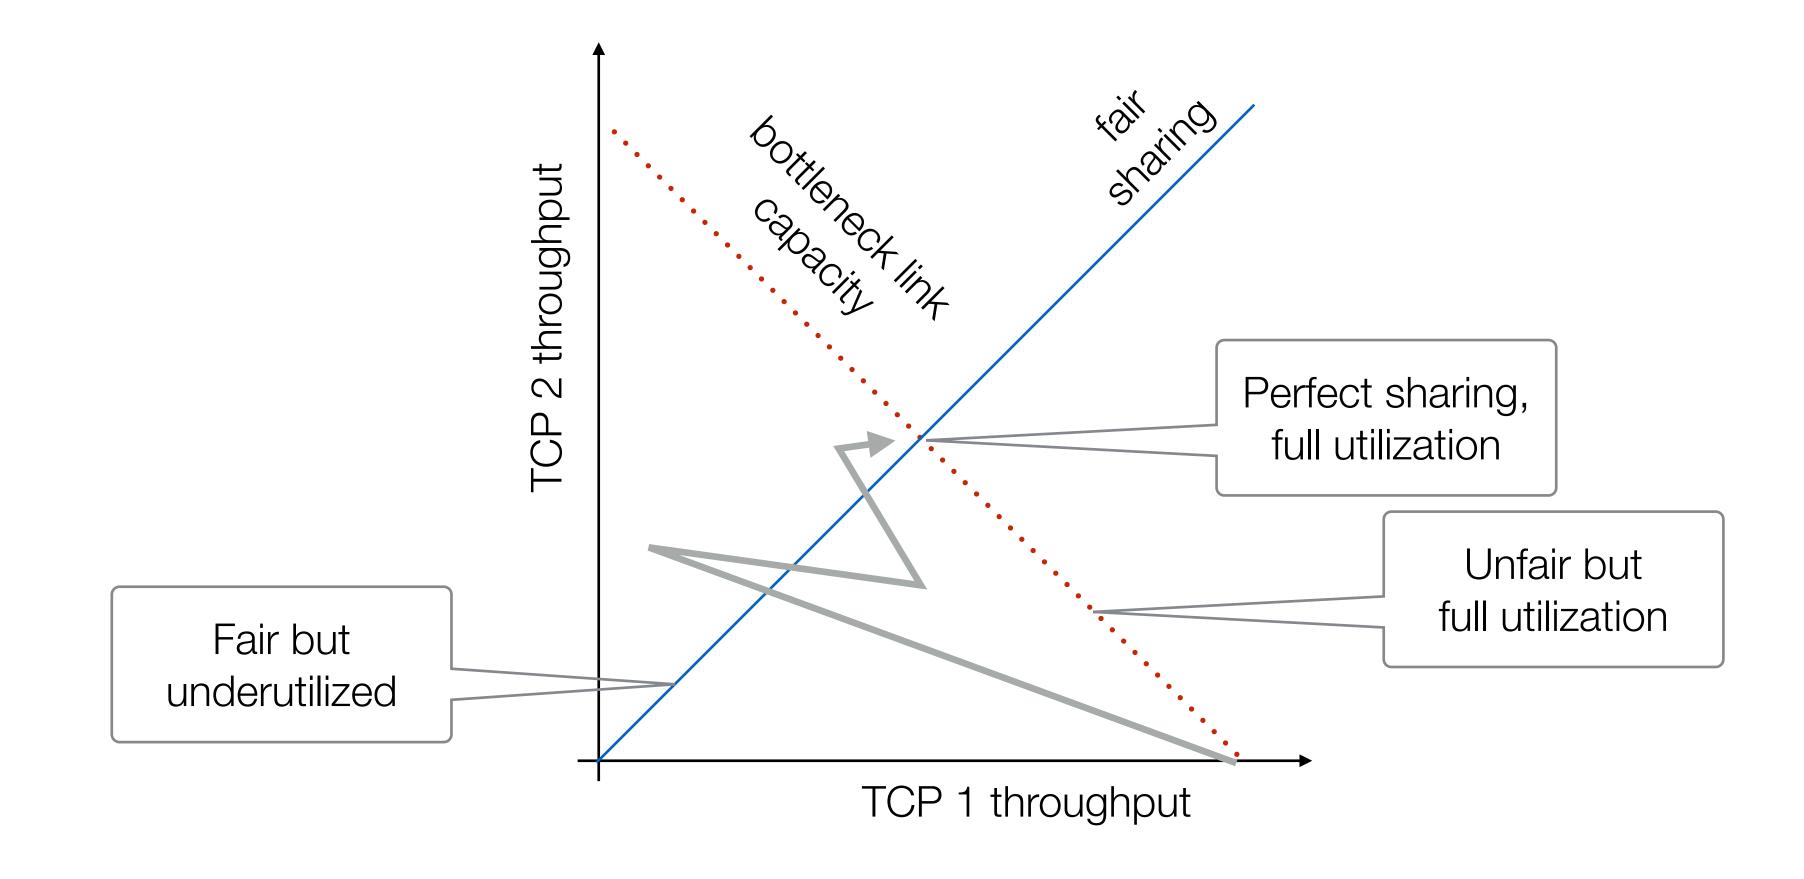

One has to be careful when making claims:

From: https://cloud.google.com/blog/products/networking/tcp-bbr-congestion-control-comes-to-gcp-your-internet-just-got-faster (interestingly, the link no longer works, a copy of the article is still available at https://www.googblogs.com/tcp-bbr-congestion-control-comes-to-gcp-your-internet-just-got-faster/)

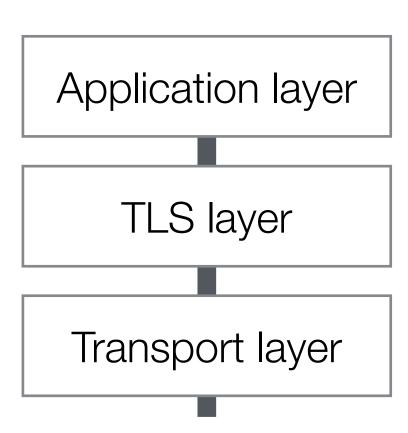

TOP Fairness

Example: two TCP connections competing with each other on a bottleneck link:

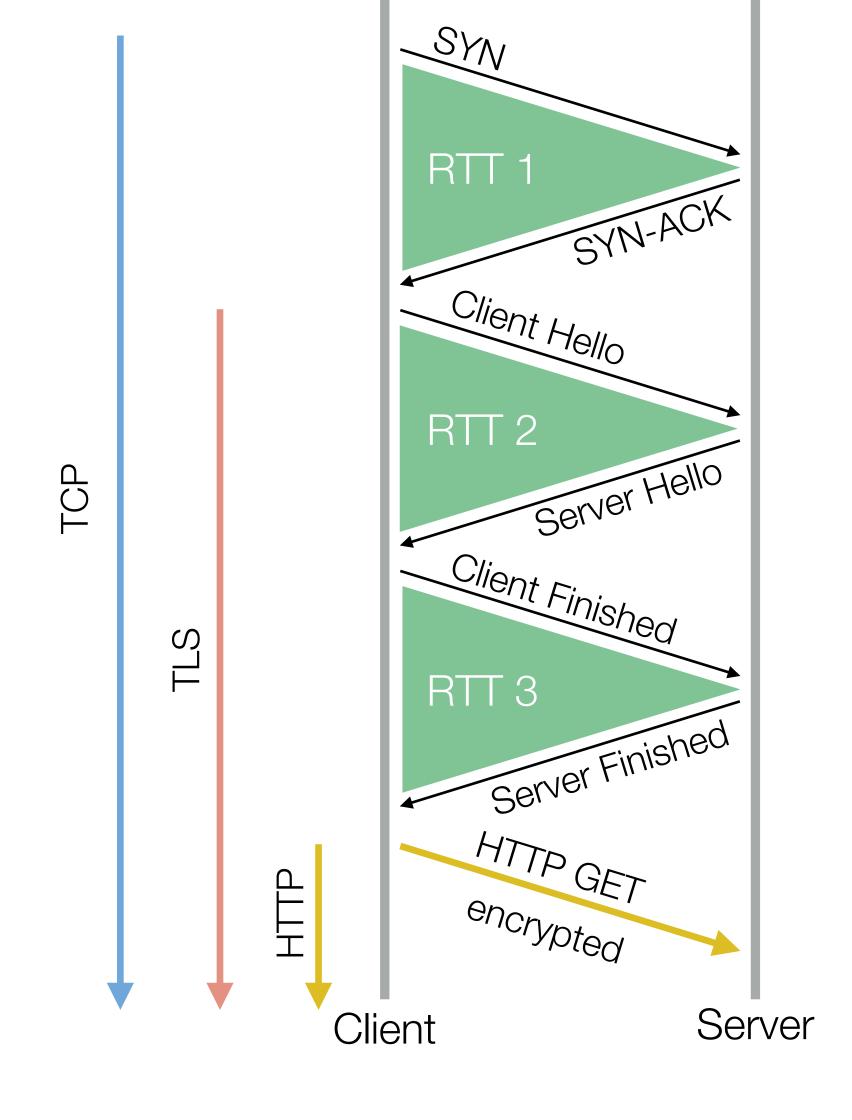

Transport Layer Security

- Transport Layer Security (TLS) cryptographic protocols that to provide privacy (encryption) and data integrity protection
- ... earlier versions known as SSL (Secure Socket Layer) is now deprecated but the term is widely used as a synonym for TLS
- Most used version TLS 1.2 (2008)
- Current version: TLS 1.3

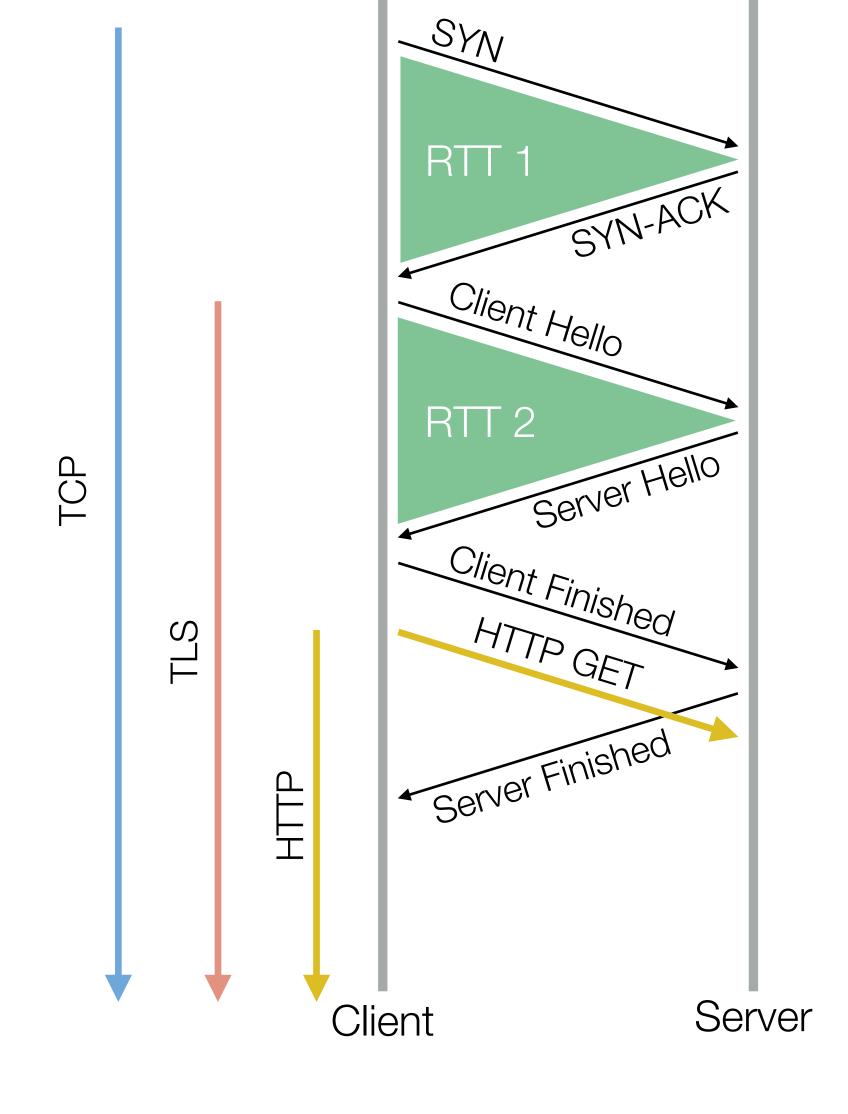

TLS 1.2

3 RTTs required to establish a secure connection

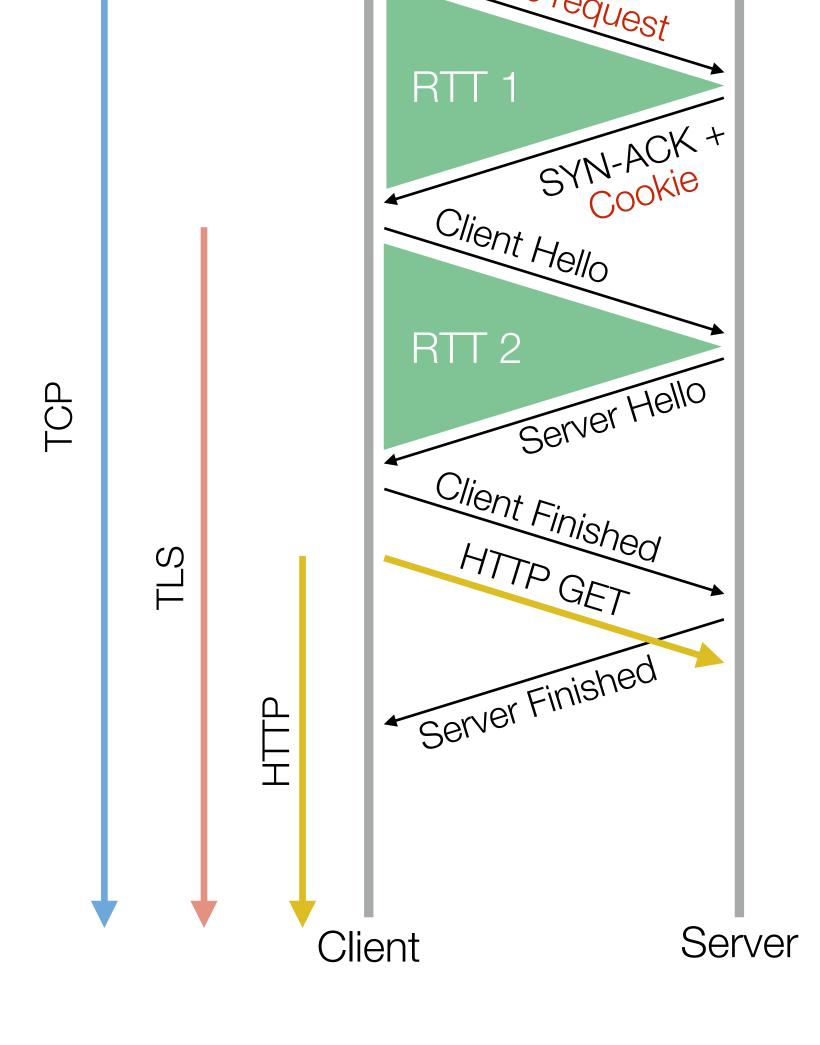

- TLS False Start option
 - 2 RTTs required to establish a secure connection

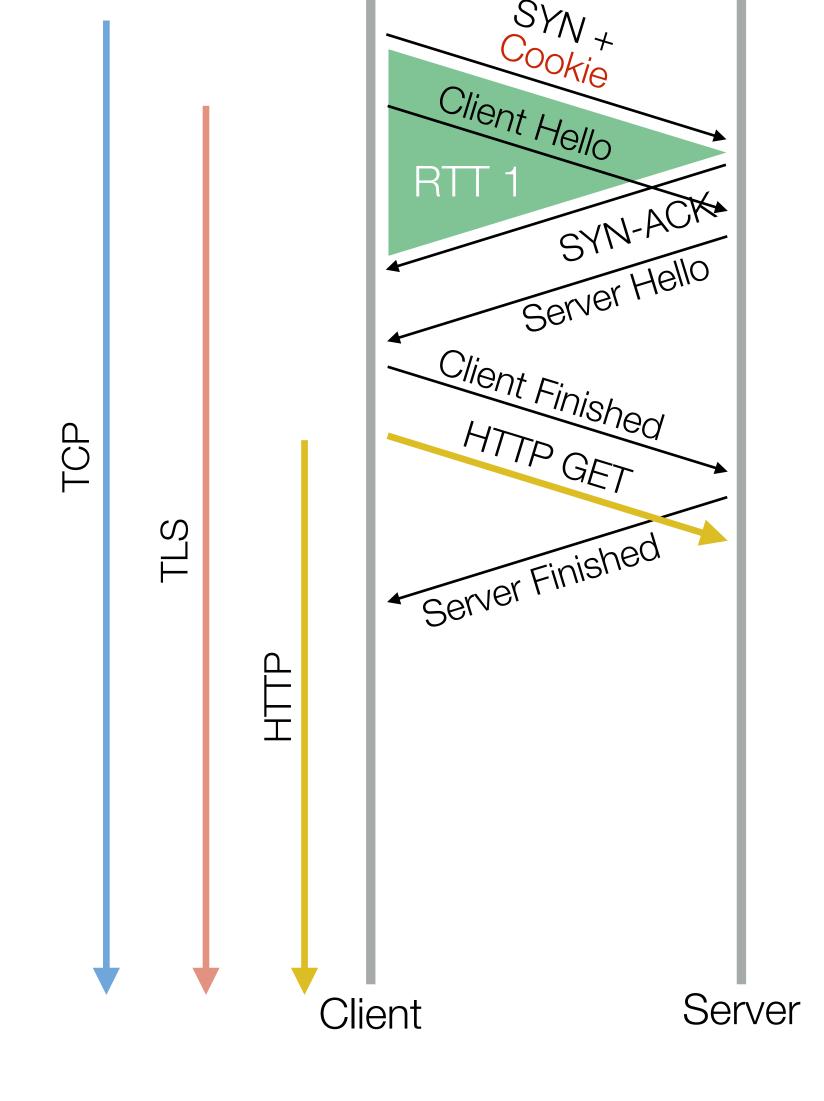

TLS Fast Open option

- when client connects for the first time, 2 RTTs are still required to establish a secure connection
- server provides Fast Open
 Cookie to be used to speedup subsequent connections

TLS Fast Open option

- for subsequent connections,
 only one RTTs required to
 establish a secure connection
- client sends previously
 received Fast Open Cookie

- ▶ 0-RTT with TLS 1.3
 - for subsequent connections

 (using Fast Open Cookie),
 HTTP command is set before
 the TLS connection is fully
 established
 - However, the initial data sent to the server is susceptible (e.g., replay attack)
