

“Spock had a big, big effect on me. I am so much more Spock-like today than when I first played the part in 1965 that you wouldn’t recognize me. I’m not talking about appearance, but thought processes. Doing that character, I learned so much about rational logical thought that it reshaped my life.”

– Leonard Nimoy

Logic in Practice

1. Eliminate \rightarrow using \neg and \vee
2. Push \neg inward using de Morgan's laws
3. Standardize variables apart
4. Eliminate \exists using Skolem functions
5. Move \forall to front
6. Move all \wedge outside any \vee (CNF)
7. Can finally remove \forall and \wedge

Logic in Practice

1. Anyone who can read is literate.
2. Dolphins are not literate.
3. Some dolphins are intelligent.
4. Prove: someone intelligent cannot read.

Skolem, standardizing apart

Unifying Two Terms

First-Order Inference

■ Terminology

Logic in Practice

1. if one is a constant and the other is
2. a constant: if the same, done; else, fail
3. a function: fail
4. a variable: **substitute** *constant* for *var*
5. if one is a function and the other is
6. a different function: fail
7. the same function: unify the two arguments lists
8. a variable: if *var* occurs in *function*, fail
9. otherwise, **substitute** *function* for *var*
10. otherwise, **substitute** one variable for the other

Carry out substitutions on all expressions you are unifying!
Build up substitutions as you go, carrying them out before
checking expressions?

See handout on website.

Tricky Cases

First-Order Inference

- Clausal Form
- Example
- Unification
- **Tricky Cases**
- Completeness
- Break
- Equality
- Specific Answers
- Res. Strategies
- Terminology

Logic in Practice

don't unify x and $f(x)$!
as in $P(x, x)$ meets $\neg P(z, f(z))$

note resolvent of $P(f(x))$ and $\neg P(z) \vee P(f(z))$

Semi-decidable: if yes, will terminate

Completeness

First-Order Inference

- Clausal Form
- Example
- Unification
- Tricky Cases
- **Completeness**
- Break
- Equality
- Specific Answers
- Res. Strategies
- Terminology

Logic in Practice

Gödel's Completeness Theorem (1930) says a complete set of inference rules exists for FOL.

Herbrand base: substitute all constants and combinations of constants and functions in place of variables. Potentially infinite!

Herbrand's Theorem (1930): If a set of clauses is unsatisfiable, then there exists a finite subset of the Herbrand base that is also unsatisfiable.

Ground Resolution Theorem: If a set of ground clauses is unsatisfiable, then the resolution closure of those clauses contains \perp .

Robinson's Lifting Lemma (1965): If there is a proof on ground clauses, there is a corresponding proof in the original clauses.

Break

Logic in Practice

Equality: $\forall xy (\textit{Holding}(x) \wedge \neg(x = y) \rightarrow \neg\textit{Holding}(y))$

Unique: $\exists! x P(x) \equiv \exists x (P(x) \wedge \forall y (\neg(x = y) \rightarrow \neg P(y)))$

Logic in Practice

Use the “answer literal”:

1. $\text{FatherOf}(\text{Alice}, \text{Bob})$
2. $\text{FatherOf}(\text{Caroline}, \text{Bob})$
3. $\text{FatherOf}(x, y) \rightarrow \text{ParentOf}(x, y)$

Query: Who is Caroline’s parent?

Resolution Strategies

First-Order Inference

- Clausal Form
- Example

- Completeness
- Break
- Equality
- Specific Answers
- Res. Strategies
- Terminology

Logic in Practice

Breadth-first: all first-level resolvents, then second-level...

- Complete, slow

Set of Support: at least one parent comes from SoS

- Complete if non-SoS are satisfiable, nice

Input Resolution: at least one parent from the input set

- Complete for Horn KBs

Simplifications: remove tautologies, subsumed clauses, and pure literals.

Terminology

First-Order Inference

Terminology

Logic in Practice

Interpretation: maps constant symbols to objects in the world, each function symbol to a particular function on objects, and each predicate symbol to a particular relation.

Model of P : an interpretation in which P is true. Eg, *Famous(BarbaraBush)* is true under the intended interpretation but not when the symbol *BarbaraBush* maps to Joe Shmoe.

Satisfiable: \exists a model for P . Eg, $P \wedge \neg P$ is not satisfiable.

Entailment: if Q is true in every model of P , then $P \models Q$.
Eg, $P \wedge Q \models P$.

Valid: true in any interpretation. Eg, $P \vee \neg P$.
