NP

NP-Completeness

P vs NPC vs EXPTIME

- shortest path vs longest path
- Euler tour (each edge) vs hamiltonian cycle (each vertex)
- minimum spanning tree vs
shortest total all-pairs path length spanning tree
- spanning tree vs vertex cover
- maximum flow vs minimum edge-cost flow (meeting demand)
- minimum cut vs maximum cut
- maximum bipartite matching vs minimum maximal matching
- addition vs subset sum
- 2-CNF satisfiability vs 3-CNF
- interval scheduling vs job shop scheduling
- value of move in checkers, Go

Exponentials

NP

if 1 step = 1 μ second:

	20	40	60
n	.00002 sec	.00004 sec	.00006 sec
n^2	.0004 sec	.0016 sec	.0036 sec
n^3	.008 sec	.064 sec	.216 sec
n^5	3.2 sec	1.7 min	13 min
2^n	1.0 sec	12.7 days	366 cent
3^n	58 min	3855 cent	10^{13} cent

(non-)effect of CPU speed:

	curr size	100×	1000×
n	N	$100N$	$1000N$
n^2	N	$10N$	$31.6N$
n^3	N	$4.64N$	$10N$
n^5	N	$2.5N$	$3.98N$
2^n	N	$N + 6.64$	$N + 9.97$
3^n	N	$N + 4.19$	$N + 6.29$

NP

tractable: polynomial in (non-unary) input

P: solvable in polynomial time

NP: verifiable in polynomial time (eg, blockchain, cloud computing)

NP-Hard: as hard as any problem in NP (via polytime reduction)

NP-Complete: NP-Hard and in NP

optimization vs decision: if opt were easy, decision would be too

reduce a to b : $a \rightarrow b$ in polytime, decide b , \rightarrow decision for a

b hard by reduction from a : if $a \rightarrow b$ in polytime and b polytime, could solve a

$P = \{L \subseteq \{0, 1\}^* : \exists \text{ algorithm that decides } L \text{ in poly time} \}$

$A(x, y)$ verifies L iff for any input $x \in L$ \exists certificate y that proves $x \in L$ and \nexists certificate iff $x \notin L$

$NP = \{L \subseteq \{0, 1\}^* : \exists \text{ algorithm } A(x, y) \text{ that can use certificate } y \text{ with } |y| = O(|x|^c) \text{ to verify } L \text{ in polynomial time} \}$

$P \neq NP?$

$\text{co-NP} = \{L \subseteq \{0, 1\}^* : \overline{L} \in NP \}$.

$NP \neq \text{co-NP?}$ eg $L \in NP \Rightarrow \overline{L} \in NP?$

polynomial-time reducible: $L_1 \leq_P L_2$ iff \exists

polynomial-time computable function $f : \{0, 1\}^* \rightarrow \{0, 1\}^*$ such that for all $\{0, 1\}^*$,
 $x \in L_1$ iff $f(x) \in L_2$.

L is NP-Complete iff $L \in \text{NP}$ and $\forall L' \in \text{NP}, L' \leq_P L$

For example:

- What's still confusing?
- What question didn't you get to ask today?
- What would you like to hear more about?

Please write down your most pressing question about algorithms and put it in the box on your way out.

Thanks!
